

While everyone knows security is important, not everyone can afford to have security experts sitting around. Whether you are trying to select a Digital Rights Management solution, set up your online presence, or keep cheaters and hackers out of your game, you can get fast, accurate, expert help from SecurePlay.

## **Predictable Pricing for Small to Large Jobs.**

Whether it is simply an answer to an email, an evaluation of a game design, or the development of a custom security architecture, IT GlobalSecure will provide the answer you need with reasonable, predictable pricing.

## **Piracy - DRM, Licensing Protection, and Distribution Security**

Our team can help you identify and implement the content protection strategy that is right for you. Whether developing a custom cryptographic security solution, evaluating commercial products, modeling costs, or recommending procedural changes, we work with you to ensure that your business is protected

## **Making Security Pay - Sustainable Engine Platforms**

Game companies make two major forms of investments – to develop creative and artistic game content and to engineer game engines, and deploy game infrastructures. While game content is increasingly exploited through licensing, the technical assets of games may often only be used once. Our services assist you in maximizing the reuse or direct sales of your gaming infrastructure, while improving your ecommerce objectives

## **Custom Anti-Cheating Solutions**

Studies have shown that over sixty percent of players are very concerned about cheating; cheating is now affecting 5-10% of game transactions. To keep players and tap the recurring revenue streams, stopping cheating must become a central part of game design.

## Fighting Hackers and Thieves - Security Engineering and Evaluations

The games industry is becoming a true e-industry. There are few real examples of industries with virtual assets and online services that customers are willing to pay real currency for. While this is an exciting business opportunity, it does expose game companies to attack from hackers and online criminals.

## Building it Right - System Engineering and Architecture Design

While our unique skill set is security, we do provide a complete range of traditional engineering and project management skills. Senior engineering skills are often scarce. Use our staff for independent reviews, technical evaluations, to resolve thorny design issues.

## Why IT GlobalSecure for Gaming?

Our key personnel average nearly 20 years of security engineering, software development, and program management. Our clients have included everyone from startups to major corporations and even government agencies.
